Amman, Jordan

EDUCATION

The Hashemite University

B.Sc. in Cybersecurity

Zarqa, Jordan · July 2026

SECURITY SKILLS

- ▶ Network Traffic Analysis
- ▶ Vulnerability Assessment
- ▶ Active Directory & GPO
- ▶ Incident Log Investigation
- ▶ Packet & Protocol Analysis
- ▶ Secure Mobile Development
- ▶ Python Scripting & Automation
- ▶ API Integration & Design
- ▶ Systems Architecture

TECHNICAL TOOLS

Network & Analysis

Wireshark · Nmap · Tcpdump

Vulnerability & Pen-testing

Nessus · OpenVAS

Burp Suite · Metasploit (lab)

Systems & Infrastructure

Kali Linux · Ubuntu

Windows Server 2022

Active Directory

VMware · VirtualBox

Programming & Dev

Python · Bash · Git/GitHub

FastAPI · REST APIs

Flutter · Dart

LANGUAGES

Arabic Native

English Professional

PROFESSIONAL SUMMARY

Cybersecurity graduate from The Hashemite University (July 2026) with hands-on lab experience in network traffic analysis, vulnerability assessment, and Active Directory security. Holder of CompTIA Security+ (SY0-701, score: 782/900, first attempt). Built CyberGuard Mobile, a real-time anti-phishing application, as a graduation project. Additional background in AI-integrated systems engineering and Python scripting, bringing strong technical problem-solving skills to entry-level SOC and Security Analyst roles.

CERTIFICATIONS

● CompTIA Security+ (SY0-701)

CompTIA · Score: 782/900 · First Attempt

June 2026

- Network Security, Threats, Vulnerabilities & Enterprise Mitigations
- Identity & Access Management (IAM), Security Architecture & Access Control
- Security Operations Fundamentals & Incident Response Workflows

● Introduction to Cybersecurity

Cisco Networking Academy

May 2026

- Defensive architectures, CIA triad principles, and foundational threat mitigation.

CYBERSECURITY PROJECTS

● CyberGuard Mobile — Anti-Phishing Application

Graduation Project · Flutter · Dart · REST APIs

2025 – 2026

- Built the complete cross-platform mobile application to help non-technical users identify and avoid phishing links and malicious URLs.
- Implemented real-time URL scanning, input validation, and secure REST API communication within the application layer.
- Integrated a phishing classification model (developed by a teammate) into the app, handling all application-side API calls, response processing, and user interaction flows.
- Personally tested the application's phishing detection and link-scanning functionality to validate behavior, detection flow, and user experience.

● Network Traffic Analysis & Protocol Investigation

Defensive Security Lab · Wireshark · Nmap · Tcpdump

2024 – 2025

- Captured and analyzed packet flows across TCP/IP, DNS, HTTP/S, and ARP protocols to identify anomalous behavior and unencrypted data exposure.
- Built targeted Wireshark display filters to isolate suspicious patterns including ARP anomalies and port scan signatures.

- Documented findings and mapped observations to practical remediation approaches, building structured incident investigation habits.

- **Enterprise Active Directory & Access Control Lab**

Infrastructure Security Lab · Windows Server · Active Directory · VMware/VirtualBox
2024 – 2025

- Deployed a Windows Server domain controller; configured organizational units, user groups, and role-based access control (RBAC).
- Implemented Group Policy Objects (GPOs) for password complexity enforcement, account lockout, and workstation security baseline hardening.
- Simulated credential abuse and privilege escalation scenarios in a controlled environment; reviewed Security Event Log entries (Event IDs 4624/4625) for investigation practice.

TECHNICAL SYSTEMS PROJECT

- **AI-Powered NPC System — UE5-AI-NPC-Brain**

Personal Project · Unreal Engine 5 · Python · FastAPI · Ollama · Faster-Whisper · Piper
2025 – 2026

Demonstrates: systems integration, API architecture, performance debugging, Python backend development, and decoupled service design.

- Designed and built a fully offline voice-to-game AI pipeline: microphone input → Faster-Whisper speech-to-text → local LLM inference (Ollama/Qwen3) → structured JSON → UE5 Behavior Tree NPC execution → Piper TTS voice response.
- Built a Python/FastAPI middleware layer to decouple Unreal Engine Blueprints from all AI components, maintaining clean separation between game logic and inference systems.
- Enforced structured JSON contracts between the LLM and game engine to ensure deterministic, validated NPC action execution.
- Resolved a critical TTS latency issue: reduced response time from approximately 25 seconds to approximately 69 ms by replacing a subprocess-per-request approach with a persistent Piper HTTP server.
- Implemented atomic file handling and audio stability checks to prevent race conditions between the Python middleware and Unreal Engine.
- Open source: github.com/YazanFMG/UE5-AI-NPC-Brain

ADDITIONAL ACTIVITIES

Independent Technical Content Creator — YouTube

Creates and publishes tutorials on Unreal Engine 5 game development and Blender 3D modeling. Manages the full production pipeline independently — scripting, recording, editing, and publishing.
